Business Process Validation (BPV) is the act of verifying that a set of end-to-end business processes function as intended.

Business processes must be validated to make sure everything works correctly, even as enterprise systems change – and that includes validation across multiple enterprise applications and interfaces, not just process segments in a single application.

When one thing changes, how do you ensure that all of your critical business processes still work as needed? If there are problems in one or more applications that support a business process, or in the integration of those systems, the consequences of disruption to the business can be serious. With Worksoft, you virtually eliminate that risk.

**End-to-End Business Process Flows**

Worksoft is the only provider of automated Business Process Validation software. Whatever your project objective – implementing or upgrading SAP®, moving to SAP HANA®, managing a hybrid cloud environment, or staying up-to-date with new releases - automated BPV reduces technology risk and ensures quality across the project lifecycle.

*“Business Process Validation is making sure that your business works.”*

The reality is that most Fortune 1000 companies rely on a complex enterprise application landscape to run their business. In addition to SAP, organizations may have dozens of enterprise systems including cloud, web, mobile, and custom apps built using .NET, Java, and more. Today, the pace of technology change has never been faster, and automation is the best way to ensure that changes to enterprise apps are deployed quickly and with very high quality.
Truly End-to-End Automation

Worksoft handles all systems end-to-end – ensuring quality and detecting problems across technologies, interfaces, data, custom systems and packaged applications – before the business is impacted.

Business Benefits

Leading global companies use Worksoft’s automated Business Process Validation software to:

Innovate Faster: Accelerate Projects
Cut cycle-times of SAP upgrades by 40% or more by eliminating manual effort to shorten project timelines. Automation helps you reduce your IT project backlog and deliver more projects with the same staff – for faster SAP HANA®, mobility, portal, and cloud projects. Improve business agility with the rapid validation of application changes to accelerate innovation, so you can get new technology into the hands of your business users sooner for a competitive advantage.

Cut Costs: Improve Efficiency
Achieve savings in the millions of dollars per year with automation. Dramatically reduce the cost and effort of managing your enterprise systems, as you reduce costs by up to 90% over manual quality assurance. Automation also helps increase staff efficiency with complete documentation of system workflows and processes for audit and compliance purposes. You’ll also increase budget predictability by lowering the risk of project variances and the costs of unexpected software failures.

Lower Technology Risk: Prevent Business Disruption
Automation will help you dramatically improve quality, reduce production defects, lower technology risk, and avoid business disruption when technology changes. This increase in quality comes with increased business process coverage and a lower overall risk of software defects. Eliminate the risk of a technology glitch and watch production defect rates drop by 80% or more. This helps you lock in a high success rate for technology projects.

Let’s Get Started

Leading global companies worldwide use Worksoft to lower technology risk, innovate faster, and cut project costs and timelines. Contact Worksoft today to discuss how to bring automated business process validation to your enterprise!
